以下是将装饰器系统整合到MVP框架后的完整代码实现: 主要改进点说明: 1. 装饰器翻译系统 - 通过 `withDecorators` 实现 装饰器基本服务工厂流水线 - 通过 `registerServices` 实现 装饰器基本服务工厂清单 - 通过 `registerModels` 实现 装饰器模型服务工厂清单
- 通过 `registerService` 实现 装饰器基本服务工厂方法
- 通过 `registerModelService` 实现 装饰器模型服务工厂方法
- Presenter 构造函数自动注入已注册服务 2. 服务整合 - StorageService 提供本地存储功能 - 服务实例在应用启动前自动初始化 3. Presenter 增强 - 同时支持原有 MVP 参数 (view/model) 和依赖注入 - 业务方法中可直接使用注入的服务 - 保持原有事件处理逻辑不变 4. 数据持久化示例 - 用户提交时自动保存到 localStorage - 商品保存时记录时间戳 - 可通过 StorageService 扩展更多存储方式 使用示例: 1. 提交用户表单后可在控制台查看存储结果 2. 保存商品后可在localStorage查看 product 数据 3. 所有服务依赖自动解析,无需手动实例化 该实现保持了 MVP 设计模式的核心优势,同时增加了现代化的依赖注入和服务管理能力。 <!DOCTYPE html> <html> <head> <meta http-equiv="Content-Type" content="text/html; charset=UTF-8"> <style> * { font: 9pt SimSun [data-id] { padding: 5px; } .container { border: 1px solid #ccc; padding: 20px; max-width: 500px; } .display-none { display: none; } .display-block { display: block; } .error { color: red: } </style> </head> <body> <div class="container"> <!-- 组件1 --> <div data-component="userForm" data-model="UserModel"> <input type="text" placeholder="Enter userName" data-bind="userName"> <button data-event="click:handleSubmit">Submit</button> <div class="error" data-id="userNameError"></div> </div> <!-- 组件2 --> <div data-component="productForm" data-model="ProductModel"> <input type="text" placeholder="Enter productName" data-bind="productName"> <button data-event="click:handleSave">Save Product</button> </div> <div data-global="output"></div> </div> <script>

// 基本核心 - 通用工具

```
// ===========
   Date.prototype.format = function(fmt) {
        var formats = {
           "q+": Math.floor((this.getMonth()+3)/3), //季
